

Expected Submission Materials

Deadline: End of Sunday, 6 September 2026

Each candidate team under consideration for finalist selection should submit the following materials.

Required Materials

1. Final Notebook / Methodology Report

- Complete description of the approach used.
- Data cleaning and preprocessing.
- Feature engineering.
- Validation strategy.
- Models tested and final model selection.
- Any ensembling or post-processing.
- Key results, observations, and limitations.

2. Complete Source Code

- All code required to reproduce the final solution.
- Must include:
 - data loading;
 - preprocessing;
 - feature generation;
 - model training;
 - validation;
 - test inference;
 - post-processing;
 - generation of the final submission file.
- If multiple scripts/files were used, submit all relevant files.

3. Final Submission / Prediction File

- The exact file corresponding to the team's leaderboard submission being considered for finalist selection.
- This should not be a recreated or modified version unless clearly stated.

4. Processed / Cleaned Dataset(s), if applicable

- Any intermediate or processed datasets used to produce the final result.
- If these can be fully regenerated from the provided code, teams may instead clearly indicate the relevant generation step.

5. README / Reproduction Instructions

- Short instructions explaining how to reproduce the final submission.
- Include:
 - required files;
 - execution order;
 - key dependencies/packages;
 - important random seeds or settings;
 - which script/notebook generates the final prediction file.

6. Final Model Information

- Identify the model or ensemble used for the final leaderboard submission.
- Include relevant hyperparameters and ensemble weights where applicable.
- If a pretrained model, AutoML system, or external package was used, clearly identify it.

Required Disclosure

Teams should also provide a short disclosure covering:

- any external datasets used;
- any external code, notebooks, repositories, or public solutions consulted or adapted;
- any pretrained models used;
- any AI tools or coding agents used;
- any manual modification or post-processing of predictions;
- any additional information used beyond the competition-provided files.

Use of AI tools is not automatically considered misconduct. The purpose of the disclosure is to establish the provenance and reproducibility of the submitted result.

Strongly Recommended

Where available, teams should also provide:

- local validation scores;
- leaderboard score associated with the submitted prediction file;
- experiment/model comparison results;
- saved model files where retraining is computationally expensive;
- package/environment file such as requirements.txt or environment.yml.

Important

The materials submitted should represent the **actual pipeline that produced the leaderboard result being reviewed**.

The finalist-selection review may verify whether:

competition data → preprocessing → modelling → inference → post-processing → final submission

can be reasonably reconstructed from the submitted materials.

Missing documentation alone will not automatically disqualify a team. However, if the submitted materials cannot plausibly explain or reproduce the leaderboard result, the submission may be held for technical review or deemed ineligible for finalist selection.
